

## Disaster Recovery

Has your company got a recovery plan? When most people think of the term recovery, they think of large scale disasters like a tornado, flood, building fire, or any number of major business setbacks.

A University of Texas study showed that more than half of all small to midsize businesses that lose their data in a disaster go out of business within two years after that disaster. Despite this fact, Gartner (an industry analyst firm that covers the technology market) estimates that less than half of all midsize businesses and only 25 percent of small businesses have disaster recovery plans in place. Think about how you could continue doing business if the area around your facility is closed or streets are impassable. Think about what you would need to serve your customers even if your facility is closed.

Those are just a few examples of situations that could happen to your business. Most people think that can never happen to them but what happens if something less drastic happens like a virus, hacker or failed hard drive corrupts your client database? What if someone accidentally deletes the wrong file or directory? Will you be able to restore this data or will you spend countless hours trying to rebuild the information from paper files and memory?

Here at Evolution Computer Systems we can help you safeguard your data by developing and implementing a well-planned backup strategy. We can help you in identifying threats, create a Disaster Recovery Plan, choose the right software and Storage combination, Implement / Test / and Train you on the solution that best fits your needs.
